MOTSA SANELISO

CSC 392- GROUP PROJECT

SOFTWARE ARCHITECT

In the group project, my role will be a Software Architect. As a Software Architect in this group project, my primary responsibility is to design a scalable and efficient architecture that aligns with the project requirements and supports the development team throughout the software lifecycle.

One of my key duties is to analyze both functional and non-functional requirements of the system. This includes understanding user needs, performance expectations, security considerations, and scalability demands. Based on this analysis, I will make high-level design decisions and design patterns that will be used to build the software.

I will be responsible for creating architectural diagrams and documentation that clearly illustrate the structure of the system, including how different components interact with each other. These artifacts will serve as a blueprint for programmers and help ensure that everyone in the team has a shared understanding of how the system should be implemented.

Another important aspect of my role is to guide and support the development team. I will work closely with other team members, such as designer, programmer, and project managers, to ensure that the architecture is properly implemented. This includes reviewing code, providing technical guidance, and resolving design-related challenges that may arise during development.

Additionally, I will ensure that best practices in software engineering are followed, such as maintainability, modularity, and reusability. I will also consider future system enhancements and ensure that the architecture is flexible enough to accommodate changes without requiring major redesign.

Communication is also a key responsibility in my role. I will regularly update the team on architectural decisions and ensure alignment between technical and project goals. By maintaining clear and consistent communication, I will help minimize misunderstandings and improve collaboration within the team.

In conclusion, as a Software Architect, I am responsible for shaping the technical foundation of the project, guiding the development process, and ensuring that the final system is reliable, efficient, and aligned with both user requirements and project objectives.
