

Name: Matsaba Phila M

Student ID: 202303087

Programme: BSc Information Science

Course: CSC 392

Software Development Manager

As a software project manager, the expected roles involve planning, monitoring, control, and closing the project upon completion or failure. Before the planning phase, the manager has to first understand the needs, requirements and expectations of the users who will use the software on their daily basis, that involves having a vision to create a user friendly software.

The planning phase begins with making reasonable cost and time estimates that will conform with the work to be done and the requirements of the users. As a manager, you need to determine the materials and equipment needed to fulfill the task, like buying or renting storages like servers. It is the manager's role to allocate each task to an appropriate and qualified individual like programmers, designers etc. It is important that the manager plans on how to avoid risks and come up with strategies on how to tackle them once encountered.

The Manager is responsible for laying and explaining the goals and objectives of the whole project to the project team, describing how to carry out the whole process, then take the lead, allowing them to use the available project resources to carry out the whole project. As a project team manager, it is important to motivate the team members, to put more effort, dedication and ensure that they work according to plan. Lastly, it is the role of the manager to establish and maintain a good communication and conducive environment that encourages knowledge sharing among team members.

The software project team manager is responsible for keeping track of progress, ensuring that the project is still going according to plan. It is important that he or she continuously check with completed tasks and compare them to the allocated budget and time and draft the needed reports of successes, failures and obstacles faced by the team

Letion of the project, the manager has to repeatedly test the software to assess its effectiveness and verify if it functions according to plan, as expected, if not, find a way to modify it without incurring extra costs and consuming more time. After this, the project manager then close the project with a success and then deliver it to its users, then keep track of how effective and efficiently the users can navigate, and interact with software without much effort.
